The University of Pennsylvania's NDMA (National Digital Mammography Archive) allows radiologists at four university hospitals to retrieve and view mammography images online. Health care and technology merge at NDMA, which is the same goal pursued by the federal government with its National Library of Medicine's Next Generation Internet (NGI) 'Internetz' initiative. NDMA is headed by the University of Pennsylvania, where Professor Hollebeek teaches physics and serves as co-principal investigator for NDMA. It stores **patient history** and gives doctors remote access to patient data, which is a time- and money-saving feature. The architects of NDMA are also the designers and maintainers of the hardware and network, who work with three contractors at Oak Ridge National Laboratory, who handle portal security and Java development. They work mostly with more recent mammogram imaging systems that generate digital images. On a 10Mbps connection, 80 seconds are required to download a 100MB mammogram, which is too slow for many physicians. Therefore, some hospitals download mammograms the night before the patient's scheduled appointment. Each participating hospital has an IBM SP2 parallel computer with parallel disks, and the archive is kept in Philadelphia on a 32-node rack-mounted IBM e1300 server with high-speed SCSI disks.

Accomplishments of Programs to Prevent Medical Errors

Despite the strikingly high incidence of medical errors documented in the IOM report, and the difficulties in obtaining reports on errors and near misses, there are remarkable examples of successful efforts to improve patient safety. Surgical anesthesia, which once had an error rate of 25-50 per mln patients, reduced its error rate nearly 7-fold. (Orkin, 1993).

The first step in reducing surgical anesthesia error rates was the collection of data that permitted a systems analysis of errors, rather than a hunt for "responsible" individuals. Through teamwork, practice guidelines, automation, procedure simplification, and standardization of many functions, anesthesiologists demonstrated that a properly designed system can either prevent mistakes or prevent mistakes from doing harm.

Another example of success is the advances in patient safety that have been achieved in the Department of Veterans Affairs (VA), through its Veterans Health Administration. For instance, a hand-held, wireless bar-coding system was introduced into VA and has reduced medication errors by 70% at relatively low cost (Gebhart, 1999).

It is particularly interesting that this approach was adopted from a completely different industry--from observation of how Avis checked in returned rental cars. Similar behavioral and cultural changes must occur in other segments of the healthcare industry in order to address the patient safety issue fully.

Many Federal agencies have learned that the creation of a comprehensive knowledge base, rich in textual description of all aspects of errors occurrence, must be developed if preventive efforts are to be targeted and effective. One hopeful sign has been the development of private-sector organizations, such as the National Patient Safety Foundation (NPSF), the National Coordinating Council for Medication Error Reporting and Prevention, and JCAHO, which are promoting research and improvement initiatives focused on systems approaches to error reduction.

The occupational health field has demonstrated that human factors engineering can identify ergonomic concepts to prevent injuries to both patients and workers. Examples include curving the design of hallway corners to reduce the risk of injury from collisions, using mechanical lifts to prevent patient falls and employee back injuries, and reducing the

50% over the next five years.

"Through Medicare and Medicaid, we can work to reduce medical errors in almost every health facility in the country," Lieberman notes. "Most people are patients at one point or another in their lives. We need to make certain they are patients in the safest possible setting."

Senator Bryan says, "This legislation is a first attempt at correcting the staggering number of deadly medical errors that occur in this country. The bottom line is that we have got to do better, and this legislation will take the first step in improving this bleak situation."

The act would require healthcare providers to:

- * Establish a program that produces measurable reductions in errors.
- * Report deaths and serious injuries, identify their causes and take steps to prevent further accidents.

- * Disclose to the public the names/addresses of facilities that don't comply with reporting requirements or implement actions to address safety problems

The bill would also establish a Center for Patient Safety, which would conduct research and award grants for reducing medical errors. It would also provide reporting confidentiality protection.

Lieberman notes that, "Medical errors happen when patients get the wrong medications or the wrong treatment. Doctors operate on the wrong body part and sometimes even the wrong person."

He feels that, "Medical errors are rampant because of the tangled and risky environment that seems inherent to healthcare facilities. Errors occur because healthcare is delivered to many patients, by scores of health professionals, over the course of many days. We depend on healthcare providers to rise above this jumble and provide flawless care. And they do -- most of the time."

He points out that, "As a result, we have a health system of stark contrasts. Healthcare in the US saves lives by the millions. And it kills by the tens of thousands."

The act includes some of the recommendations of the Institute of Medicine and President Clinton.

"The President and IOM deserve credit for recognizing that errors are preventable, and praise for recommending specific steps to immunize our medical system from mistakes," Lieberman concludes.

PCS, Systems Plus Team Up On Electronic Scripts

Health Data Network News, v4, n16, pN/A

Nov 20, 1995

Language: English Record Type: Fulltext

Document Type: Magazine/Journal; Trade

Word Count: 264

TEXT:

Physician users of The Medical Manager practice management software will have low-cost access to **electronic prescriptions** and **related** services by next April.

On Nov. 8, Systems Plus Inc., Mountain View, Calif., publisher of The Medical Manager, and PCS Health Systems Inc., Scottsdale, Ariz., agreed to jointly develop PCS Link, giving physicians access to two PCS services---Rx Inquiry and Rx Authorization.

Pricing for the software hasn't been finalized, but PCS likely will pay at least a portion of the cost for physicians who want it, says Daniel Segedin, vice president of health systems management for PCS. "It will not be a large fee to the physician," he says, adding that PCS will make its money off transaction fees.

In production now and being used by physicians in Louisville, Ky., Rx Authorization enables physicians to electronically transmit prescriptions and refill requests and authorizations.

Rx Inquiry, to be introduced in January, will provide **patient drug histories** from PCS' extensive databases.

PCS is a major pharmacy benefit manager serving 55 million covered lives and a pharmacy claims clearinghouse with links to more than 53,000 pharmacies and annual processing volume of more than 350 million claims.

PCS has the ability to connect to about 30,000 physicians through its affiliation with health information network developer Integrated Medical Systems, Golden, Colo.

But the agreement with Systems Plus gives it the potential to link to more than 100,000 physicians in the 21,000 practices that use Medical Manager.

Systems Plus will market PCS Link and PCS will assist in training physicians and their staffs.

TEXT:

Health care vendors, application developers and clearing houses should look to the retail pharmacy industry for electronic data interchange (EDI) opportunities. Although a majority of retail pharmacies--99 percent--use EDI to process claims from third-party payers, a "new frontier" of opportunities exists for connecting physician offices with pharmacies to send prescription claims electronically, industry experts told ECPR.

The number of doctors' offices connected to pharmacies by EDI is "very small," said Klaus Hieber, director of pharmacy services at the Health Alliance Plan (HAP), a managed care provider based in Detroit, Mich. Sending electronic claims prescriptions would give physicians on-line, real-time access to "formulary" guidelines and drug utilization reviews (DURs), he said.

Doctors are encouraged by hospitals, pharmacies and insurance companies to prescribe standard or "formulary" drugs for certain treatments because of their cost effectiveness.

Certain drugs also fall under DUR status, which alerts the physician to potential adverse effects medicine may have on patients.

The instant availability of this information at the point-of-service rather than the point-of-sale would reduce the time and costs associated

with pharmacy calls to doctors to straighten out miscommunications, said Hieber.

Prescription Rejects

Dom Meffe Jr., chief operating officer for Greensburg, Pa.-based Columbia Pharmacy Solutions, a wholly owned subsidiary of Columbia/HCA Healthcare Corp., said that 20 percent of prescription claims are sent back because of bad handwriting, non-compliance with formularies, duplicate therapy or excessive dosing on the part of the physician. "These errors create a waste of time and add costs to the system," he said.

"Putting [electronic connection software functions] in the prescriber's office will guarantee compliance."

The success of doctors and pharmacies using EDI to send prescription claims depends largely on the willingness of the doctors to embrace the technology, Hieber believes.

Meffe said that pharmacists are more than familiar with EDI. They're "a world ahead of the rest of the health care industry," he said.

Jerry Mizer, director of marketing for Twinsburg, Ohio-based MEDE AMERICA, said that the "Pharmacy [business] is at least a decade ahead of medical. With pharmacy, everything is on-line, real-time."

Carpe Diem

Numerous application developers are looking to this EDI market as an opportunity, and bringing new products to the market and pilot programs to the industry, such as IBM.

Integrated Systems Solutions Corp., a Big Blue subsidiary, purchased Prescribe, a software system from the Chicago, Ill.-based Walgreen Co. retail pharmacy chain.

Walgreen already is using the system and Clearwater, Fl.-based Eckerd Corp. is in the process of reviewing and evaluating the system, said Rich Coyle, director of communications for Integrated Systems.

Eckerd is a retail chain, with 1,701 drug stores in 13 states from Texas to Delaware.

Coyle said that this opportunity for connecting pharmacies and doctors is a part of the whole trend toward "people using the power of networks."

"Prime users of the Prescribe system would be national pharmacy chains who would be looking to use networks to get greater efficiency in their operations," he said.

HAP and Columbia

Other evidence of vendor interest in this market can be found from California to the East Coast.

In two days, Detroit's HAP will launch a pilot program connecting 10 of its physician offices to the plan's participating pharmacies. The offices will be connected using Fort Lauderdale, Fla.-based ProxyMed's pharmacy management software program, ProxiScript.

Columbia will choose a managed care organization by the end of the month for its pilot program to allow physicians to submit prescription drug orders and refill authorizations electronically for both financial and clinical transactions. MEDE AMERICA is providing the electronic switching for the pilot.

Meanwhile, the National Wholesale Druggists' Association (NWDA) Service Corp. is allying with Sterling Software Inc.'s Network Services Division. Dublin, Ohio-based Sterling will develop information sourcing and delivery systems for NWDA HEALTHCOM members, which include major pharmaceutical manufacturers and wholesalers.

Scottsdale, Ariz.-based PCS Health Systems Inc. entered into an agreement last week with Mountain View, Calif.-based Systems Plus Inc. and Alachua, Fla.-based Personalized Programming Inc. to develop and market PCS Link, a prescription drug management software. PCS Link will give physicians access to PSC's Rx Inquiry and Rx Authorization. Rx Inquiry allows physicians to request complete **patient drug histories** on-line. Rx Authorization links physicians to pharmacies and enables physicians to transmit prescriptions and authorize or deny refill requests

electronically.

Pilot Programs

Columbia's pilot with MEDE will be evaluated after about six months, says Meffe. "We will know by then if we're making any impact," he said.

Mizer believes the pharmacy market is saturated with vendors and nearly exhausted as far as electronically connecting it to payers. MEDE has made a strategic decision not to pursue a share. It is concentrating instead on connecting physicians to pharmacies.

Columbia/HCA is one of the nation's largest providers of health care services, with 325 hospitals and more than 100 outpatient surgery centers in 36 states, England and Switzerland.

Connecting doctor's offices to pharmacies via EDI is a "paradigm shift," Meffe said, but unlike the automobile industry, people won't lose their jobs.

ProxyMed will install ProxyScript in the 10 HAP participating offices. Having the physician connected to the pharmacy saves the doctor, the pharmacist and even the patient unneeded hassles, Hieber said.

The Proxyscript software allows physicians to access pharmacy-related patient data at the physician's office, screen for appropriate medication and electronically **generate** and transmit **prescriptions** through ProxyMed's **computerized** health care information network to local pharmacies. The patient isn't burdened with finding out a drug isn't covered by his insurance at the pharmacy, he said. Pharmacists and physicians don't waste time and money talking on the phone to clear up errors, Hieber said.

ProxyMed

In addition to ProxyScript, ProxyMed will provide HAP with ProxyNet, a network connecting physicians and pharmacies; RXReceive, software in the pharmacy; and its Clinical Command Center, the software setup for managed care organizations.

HAP has 500,000 enrolled members through nearly 3,500 physicians. It also operates 32 medical centers and 35 hospitals throughout Michigan.

Jack Guinan, president of ProxyMed, didn't place a dollar value on prescriptions handled during the pilot, but told us it would be in the hundreds of thousands of dollars.

Connecting physicians and pharmacists is "very advantageous for the managed care environment," he said. "Cost containment helps managed care environments, private physicians and pharmacies." SPECIAL REPORT: Controversy Grows Over Managed Rx Care and Patient Privacy
Drug Outcomes & Managed Care, pN/A

Sept 27, 1995

Language: English Record Type: Fulltext

Document Type: Magazine/Journal; Trade

Word Count: 1117

TEXT:

Is the information in a prescription only for the eyes of the prescriber, patient, and pharmacist? Or does a pharmacy benefit manager (PBM), who administers drug programs for the patient's employer, have the right to examine and suggest changes to a prescription?

If a PBM mails a patient information about a drug that addresses that person's specific medical condition--a drug different from what the person is taking--is that an invasion of privacy or a legitimate business practice that also improves the quality of medical care?

These are some of the tricky questions that the pharmacy benefit industry and state pharmacy regulators are addressing. The concern over patient privacy is growing, in part, because several major drug companies now own PBMs.

For example, Eli Lilly owns PCS Health Systems which serves 55 million people. Although PCS gathers **patient drug histories**, it is prevented from sharing them with Lilly. This was one of the conditions that federal regulators insisted on before approving Lilly's acquisition of PCS.

Another reason for growing concerns about privacy violations is that physicians are beginning to file their prescriptions electronically with pharmacies. And managed care plans or employers may begin to require that physicians send electronic prescriptions directly to PBMs, rather than pharmacists, opening the door to inappropriate uses of data by the middleman.

Only a handful of PBMs, including PCS, are experimenting with electronic prescriptions. Electronic prescriptions could become commonplace within five years, predicts Daniel Segedin, vice president of health systems management for PCS.

Confidentiality Concerns

Wary of the implications of an all- **electronic** system for **prescriptions**, the National **Association** of Boards of Pharmacy (NABP) wants to develop model legislation that creates a road map for what prescription information is confidential, and what is not. NABP passed a resolution earlier this year calling on states "to promulgate legislation and/or regulation to encourage the development of technology which will require that the transmission of electronic prescriptions from prescriber to pharmacist not be compromised by interventions, control, or manipulation of said prescriptions by any other parties." In June, a task force began drafting the legislation.

NABP is concerned that as the flow of electronic as well as paper prescriptions directly to benefit managers grows, the benefit managers may make inappropriate use of the data. "Our members are concerned that prescriptions are being channeled to PBMs who are changing them to meet formulary guidelines or therapeutic decisions," says Carmen Catizone, the association's executive director. "Those altered prescriptions are being transmitted to pharmacies. These decisions should be made by pharmacists and prescribers."

But PBMs, for their part, deny that prescriptions are being intercepted and changed without physician approval. They argue, however, that their business of providing the best drug benefit plans at the lowest cost gives them the right to make sure that prescriptions are therapeutically legitimate, as well as included in a formulary,

"To be honest, there are a few PBMs that blur the line," says John Jones, director of contracting and compliance for Prescription Solutions, which serves 3,5 million covered lives. "We do everything possible to make sure that we don't violate patient confidentiality. But on the other hand, we have a mandate from our clients to take action to reduce their drug dollar."

When a physician submits a paper or electronic prescription to a pharmacist, the pharmacist typically uses an on-line system to send the information to a benefit manager for review. The manager provides immediate drug utilization review to pharmacists before a prescription is filled, informing them if the prescribed drug is not included in an approved

formulary or could interact with other drugs the patient is taking. Pharmacists who get such information then can call the prescribing physician to suggest a different drug.

PCS says this prospective review of prescriptions prevents problems before they occur. For example, an inappropriate prescription could lead to hospitalization for a severe reaction. And if a drug isn't covered by a managed care plan, the patient might have to pay more for the prescription. "That is the type of information that the patient, physician, and pharmacy would like to have," says Segedin of PCS.

The Real Fear

But to Frank Wickham, executive director of the Ohio Board of Pharmacy, prospective review of prescriptions by PBMs is a violation of patient confidentiality. "The Ohio Board has always taken the position that the information on a prescription belongs to the individual and it cannot be released without the individual's approval," he says.

The real fear of regulators is that as prescriptions become electronic, they will move from the prescriber directly to the PBM before reaching the pharmacist. As a result, benefit managers would be able to change the prescription without telling the prescriber or pharmacist.

But benefit managers like PCS reject that scenario. "We certainly think it would be unethical to change a prescription a physician wrote and then send it on to the pharmacy," says Segedin. Physicians will always have the final say on a prescription, he adds. "We're not mandating that the physician do anything. We're just giving him more information to make a decision."

NABP's plan to draft model legislation is an effort to protect patient confidentiality rather than an attempt to stop electronic prescriptions, Wickham says, adding that the Ohio board supports the move toward electronic prescriptions. But as PBMs increase their use of automation, they will be tempted to use electronic data inappropriately, he argues.

Some Examples

Wickham, for instance, has received several complaints that staff members of PBMs have posed as pharmacists when calling physicians to suggest changes to a prescription. And there are more sinister examples, he says, citing an Ohio school district that several years ago got a list from its PBM of recent prescription histories of people it was considering hiring as teachers. The district wanted to find prescriptions that indicated a pregnancy so it could avoid offering contracts to those teachers.

Jones of Prescription Solutions acknowledges that all benefit managers need to review the ethics of their business procedures. For instance, he argues that managers should avoid selling patient-specific information to drug manufacturers because the practice is an invasion of patient privacy.

Benefit managers also should refrain from informing employers about the prescriptions of their employees. "I can tell you that would set you up for some major legal activity," he says. "But if we send a letter to a member saying, 'You can have a cap on your benefit and this drug is cheaper,' or, 'The drug you are using is non-formulary,' a lot of patients appreciate that," Jones adds. "These things are confidential and sent only to the individual." --adapted from an article in the Faulkner & Gray newsletter Automated Medical Payments News.

ABSTRACT: An emerging consensus supports online communication between patients and physicians in an existing relationship to improve the quality, timeliness, and efficiency of medical care. These practices call for a new regulatory paradigm to ensure accountability, establish acceptable parameters for online medical practice, and distinguish online health care delivery from online health information.

ABSTRACT: A patient's medical records are generally fragmented across multiple treatment sites, posing an obstacle to clinical care, research, and public health efforts. Electronic medical records and the internet provide a technical infrastructure on which to build longitudinal medical records that can be integrated across sites of care. Choices about the structure and ownership of these records will have profound impact on the accessibility and privacy of patient information.

Financial incentives and drug spending in managed care

Hillman, Alan L; Pauly, Mark V; Escarce, Jose J; Ripley, Kimberly; et al
Health Affairs (HAF), v18 n2, p189-200, p.12

Mar 1999

ISSN: 0278-2715 JOURNAL CODE: HAF

DOCUMENT TYPE: Feature

LANGUAGE: English

RECORD TYPE: Fulltext; Abstract

WORD COUNT: 4631

ABSTRACT: A study estimates the impact of patient financial incentives on the use and cost of prescription drugs in the context of differing physician payment mechanisms. A large data set was developed that covers persons in managed care who pay varying levels of cost sharing and whose physicians are compensated under 2 different models: independent practice association-model and network-model health maintenance organizations.
